

DETROIT CONNECT REMOTE UPDATES

Optimize fleet performance over-the-air.

Engine and powertrain updates made easy

With Detroit Connect® Remote Updates, there will be instances where drivers no longer need to stop and physically connect their vehicles to initiate parameter changes and updates. Using secure, over-the-air programming and a cellular connection, Remote Updates allows you to make select engine parameter changes for eligible Daimler trucks in your fleet — all from the Detroit Connect portal.

Select engine parameter settings can be changed remotely to set maximum truck speeds and cruise control speed limits for drivers. In addition, Remote Updates allows fleet managers to make system changes when trucks are not in service.

With the ability to adjust parameters from the Detroit Connect Portal, it's easy to ensure your trucks are operating as they should.

Remote Updates is exclusively available via the proprietary connectivity platform in new Freightliner and Western Star trucks. Within this platform, you can make updates to:

- ✓ Motor control module
- ✓ Common powertrain controller
- ✓ Transmission control module
- ✓ Aftertreatment control module
